

Add Custom Slots to a Lex Chatbot

Michael K.

Introducing Today's Project!

In today's project, I used Amazon Lex to create custom slots for user Bank account assessment.

What is Amazon Lex?

Amazon Lex is a fully managed artificial intelligence (AI) service from AWS that lets you build voice and text conversational interfaces using Natural language

One thing I didn't expect in this project was...

One thing I didn't expect in this project was how fast i have achieved it

Slots

Slots are pieces of information that a chatbot needs to complete a user's request. They are like blanks that need to be filled in a form.

By adding custom slots in utterances, my chatbot's users can directly ask for their account balance by giving the type of account without waiting for the bot to ask for it first.

In this project, I created a custom slot type to define the Bank account type Information that the Bot has to acknowledged whenever it is been entered by the user.

Slot type values
Modify the list of values used to train the machine learning model to recognize values for a slot.

Q Search slot type values

Checking	Tab or ; or enter return for new value	X
Savings	Tab or ; or enter return for new value	X
Credit	Tab or ; or enter return for new value	Add value
credit card	visa	X
mastercard	amex	X
american express		X

Maximum 140 characters. Valid characters: A-Z, a-z, 0-9, @, #, \$

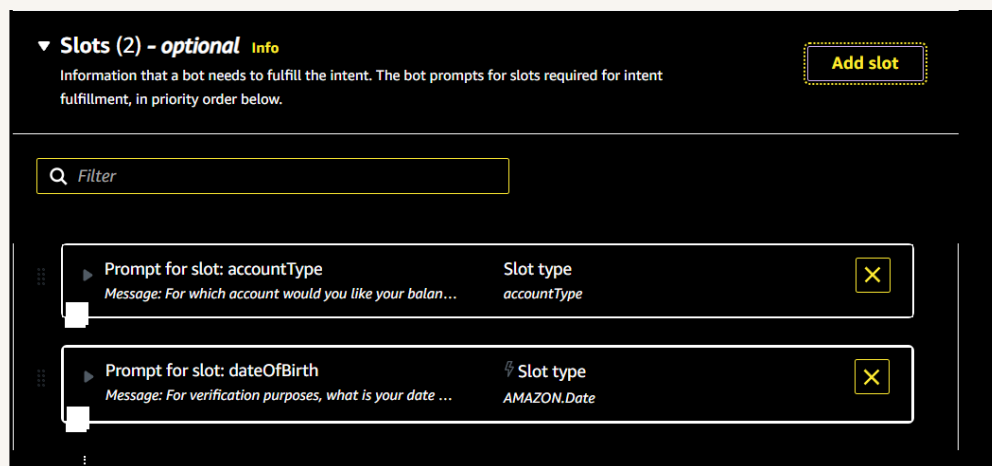

☐ Use slot values as custom vocabulary [Info](#)

Connecting slots with intents

This slot type has restricted slot values, which means that lex will consider only the values that i specify as a valid accountType! If Lex starts uses machine learning and start accepting other values outside of the set ones, users could end up having conversations about bank account types i don't actually offer!

I associated my custom slot with CheckBalance, which is used to check the users account balance and verify it with the user's birthday Information.

Slot values in utterances

I included slot values in some of the utterances (i.e. user inputs) by defining a curve bracket variable (accountType) which the bot will use to compare it with the set accountType slot and determine the account type. For example, "How much do I have in {accountType} ?

Inspect

Summary | JSON input and output

Intent

Slots	Elicitation
accountType	Savings
dateOfBirth	1998-03-04

Active contexts

Number of turns or seconds

Test Draft version

Last build submitted: 29 minutes ago

Inspect

Savings

For verification purposes, what is your date of birth?

03/04/1998

Intent CheckBalance is fulfilled

Ready for complete testing

Handling failures in slot values

Sorry i don't have that. Could you give me the account in question
